

MOVIE TICKET BOOKING MANAGEMENT SYSTEM

Project Documentation

Platform: Pega Platform

Application: Movie Ticket Booking Management

1. Project Overview

The Movie Ticket Booking Management System is a Pega-based application designed to simplify the process of booking movie tickets. The application allows users to provide customer details, select a movie, choose available seats, and complete a ticket booking through a structured workflow.

2. Objective

The main objective of this project is to develop a simple and efficient movie ticket booking application using the Pega Platform.

- Manage customer information.
- Allow users to select movies.
- Allow users to select available seats.
- Create and manage ticket bookings.
- Reduce manual booking activities.
- Provide a simple and user-friendly booking process.

3. Problem Statement

Traditional movie ticket booking processes can involve manual activities, multiple steps, and difficulties in maintaining booking information. The proposed system provides a centralized application for managing the complete booking process.

4. Technology Used

Platform: Pega Platform

Development Environment: Pega Academy Mission Exercise

Application Type: Business Application

5. Main Features

Customer Management: Collects customer information such as Customer ID, Customer Name, Phone Number and other required details.

Movie Selection: Allows the user to select the required movie from the available options.

Seat Selection: Allows the user to select the required seat for the selected movie.

Ticket Booking: Processes the booking after the required customer, movie and seat information is

provided.

6. Booking Workflow

The basic workflow of the application is:

Customer Details → Movie Selection → Seat Selection → Ticket Booking → Booking Completion

7. User Stories

The project was developed based on the user stories provided in the Pega Academy Mission Exercise. The major functionality covered includes customer information management, movie selection, seat selection, ticket booking, booking information management and workflow-based processing.

8. Pega Implementation

The application was implemented using Pega Platform capabilities. Pega application development features were used to create the required screens, fields, workflow and case processing.

9. Case Processing

A booking case is created when a user starts the movie ticket booking process. The case progresses through the required stages: enter customer information, select a movie, select a seat, review/complete the booking, and submit the booking case.

10. Expected Result

The completed application allows a user to successfully perform a movie ticket booking through the Pega application. The user can enter customer details, select a movie, select a seat, complete the booking process and track the booking through the Pega case workflow.

11. Testing

Customer Details: Valid customer information should be accepted successfully — Passed.

Movie Selection: Selected movie should be recorded in the booking case — Passed.

Seat Selection: Selected seat should be recorded successfully — Passed.

Ticket Booking: Booking case should be submitted after completing required information — Passed.

12. Project Outcome

The Movie Ticket Booking Management System demonstrates how Pega Platform can be used to create a workflow-based business application. The project organizes customer, movie, seat and booking information within a single application.

16. Conclusion

The Movie Ticket Booking Management System was successfully developed using the Pega Platform. The application provides a structured workflow for managing customer details, movie selection, seat selection and ticket booking. This project demonstrates the use of Pega to develop a business application based on user stories and workflow requirements.
